Licenses-Based Services

ennVee's Software Licensing Services

Managing software licenses efficiently is crucial for cost optimization and compliance. ennVee provides comprehensive Software Licensing Services to help organizations assess, analyze, and optimize their licensing architecture, ensuring maximum value from their software investments.

The Challenge of Managing License Compliance and Optimization

Organizations often face challenges in maintaining proactive compliance with software vendors, risking penalties and overspending on unused licenses. Misalignment between business operations and licensing agreements can lead to costly audits and inefficient resource utilization.

Right-to-Use Licenses and Audit Readiness

- Detailed evaluation of **core licenses** and their usage.
- Reviewing **Master License Agreements** to ensure alignment with audit requirements.

Application Layer Optimization

- Assessing user-based licensing models for better cost control.
- Identifying licensing based on COGS (Cost of Goods Sold) to align with financial strategies.

BYOL (Bring Your Own License)

Oracle BYOL enables customers to leverage their existing on-premises Oracle licenses when moving to Oracle Cloud, including **Oracle Cloud Infrastructure (OCI)** or **Oracle Cloud at Customer**. This approach helps organizations maximize their software investment and reduce costs by reusing licenses they already own instead of purchasing new ones for the cloud.

How Does BYOL Work?

- Customers can map on-premises licenses to equivalent Oracle Cloud services based on Oracle's **PaaS and IaaS Universal Credits Service Description.**

- BYOL supports Oracle Cloud at Customer, extending cloud functionality to on-premises data centers.

- BYOL can also be utilized with **AWS, Azure,** and **Google Cloud Platform.**

- Oracle's **Universal Credit Model (UCM)** allows BYOL customers to pay for cloud services based on OCPU usage.

- With Oracle's **BYOL-to-PaaS** program, customers can apply on-premises licenses to Oracle PaaS services.

- **License Mobility** enables flexibility to move licenses between on-premises and cloud environments.

- The **Multitenant requirement** for BYOL with Autonomous Database (ADB) has been lifted, simplifying adoption.

Strategic Solutions for Optimization

- **Regularization Services** – Aligning current user base with optimized licensing models to reduce costs.

- **Virtualization Strategies** – Utilizing Oracle VM in Oracle Server Licenses to optimize server-based licensing.

- **Oracle's Trust-Based Licenses** – Leveraging Oracle's Trusted Partitions policy to enhance compliance without added costs

Outcome: Maximized Efficiency and Compliance

With ennVee's tailored licensing services, organizations achieve:

- **Proactive Compliance:** Annual compliance audits become smoother with reduced risk of penalties.

- **Cost Optimization:** Efficiently aligning licenses with active users, leading to reduced expenditure.

- **License Optimization:** Identifying unused licenses for potential cost recovery or credit towards **Application Management Services (AMS)**.

- **Operational Efficiency:** Streamlined licensing models that support growth and minimize administrative overhead.
